

1 **ABSTRACT OF THE DISCLOSURE**

2 An adjustable device includes a first disk mounted on a side of the first stand to
3 have a finger hole to movably receive therein a finger, a second disk mounted on a side
4 of the second stand to combine the first disk and having multiple adjusting holes defined
5 in a peripheral edge of the second disk to allow an extension of the finger and a sliding
6 plate sandwiched between the first disk and the second disk and movable between a first
7 position where a free end of the finger is detachably engaged with a free end of the
8 sliding plate and a second position where the free end of the finger is separated from the
9 sliding plate and is received in a very last adjusting hole of the second disk, in which a
10 relative angle between the first stand and the second stand is maximum.
